

## Foreword

This book contains the results of traffic counts and analysis conducted by the Traffic Engineering and Road Safety Section of the Nova Scotia Department of Transportation and Infrastructure Renewal since 2008. All available count information from 2008 to 2017 is included for the following highways:

1. 100 Series Highways.
2. Trunk Highways.
3. 200 and 300 Series Collector Highways.

Electronic copies of this publication are available on TIR's **Intranet** and **Internet** sites.

## Introduction

An explanation of abbreviated terms used in this book.

### Types of counts and analysis:

**TC - Traffic Count.** This type of count is **volume only** conducted with a portable traffic counter connected either to a single road tube (counts each vehicle's axles and divides by two) or to in pavement loops (counts vehicles passing over them by detecting a magnetic field). These counts are one week in duration.

**VC - Vehicle Classification.** This type of count is conducted with a portable traffic counter connected either to road tubes (two parallel) or to in pavement loops (two parallel), both counting vehicles and classifying them. These counts are one week in duration.

Permanent Count Sites using in pavement loops (two parallel) collect volume, length classification, and speed data. Permanent sites that additionally have in pavement piezo electric sensors include volume, length and axle classification, speed, as well as weights of vehicles. These sites provide year round data.

**Radar** - This type of count is conducted with a radar and includes volume, length and speed.

**TM - Turning Movement.** These represent the various approach movements (left, thru, right) that pass through an intersection over a given period of time. They are collected for a variety of purposes at signalized and unsignalized intersections. A Turning Movement count may be used to conduct a Signal Warrant Analysis, Left/Right Turn Lane Warrant Analysis and Capacity Analysis.

**PP - Priority Points.** Signal Analysis Points based on 2014 TAC (Transportation Association of Canada) Traffic Signal Warrant Matrix Procedure (2005).

**SA - Signal Analysis.** Driven by **PP** description.

**LT** - Left Turn Lane warrant nomographs within the Geometric Design Standards for Ontario Highways.

**RT** - Right Turn Lane warrant nomographs prescribed by the Ohio Department of Transportation.

### Other Abbreviations:

**ADT - Average Daily Traffic.** The average number of vehicles passing the count location in a 24 hour period based on a temporary count.

**AADT - Annual Average Daily Traffic.** The average number of vehicles passing the count location in a 24 hour period, averaged on the basis of one year. AADT's are determined in two ways:

1. From actual year long counts.
2. By estimation from a temporary count, using seasonal and group expansion factors.

**GRP - Group** .The ADT at a particular location will vary due to seasonal and other influences. Count locations are "grouped" according to their seasonal variation patterns. Appropriate factors for estimating the AADT from a short count vary between groups. Group "AA" counts have the least seasonal variation while Group "H" have the greatest.

**85 %** - This is the speed at which 85% of the vehicles are traveling, or less. 85% speeds are based on all vehicles and may not represent free flow conditions.

**% TRK** - Truck % of AADT.

**DIR** - The direction vehicles are travelling (if the direction is not stated, the count is a two-way volume).

**Inter/s** - Intersection

**Inter/c** - Interchange

**Note:**

- ❖ The Cabot Trail is referred to as Trunk 30.
- ❖ Northwest Arm Dr is referred to as Trunk 32.
- ❖ Bedford Bypass is referred to as Trunk 33.
